

microdentistry

it's what sets us apart... is it for you?

An oral assessment will determine whether **microdentistry** or traditional dentistry will be required for your oral health. Or perhaps a combination of the two!

What is microdentistry?

Microdentistry is the practise of early detection and early treatment with non evasive revolutionary methods. Dr Simon Wenley is a member of the World Congress of Micro Dentistry and has attended courses in USA and Australia to keep up to date with the latest advances in dental techniques. That results in our team being absolutely committed to providing you with the best and most comfortable dental care available in the world today.

Early detection

Laser diagnostic equipment enables us to find cavities and even potential cavities, that traditional manual dental probes and X-rays would often miss. This means early treatment and repair before the pain sets in or before major repair work would be required. Regular dental visits involving our diagnostic

laser equipment will ensure healthier teeth and in most cases – pain free fillings! You'll save time, money AND pain! Everyone benefits from early detection oral assessments.

Waterlase™ laser treatment

Traditional dentistry means high pitched whining drills and face numbing anaesthetic. Although many people cannot avoid traditional dentistry, most can benefit from new procedures that make your dental experience far more pleasurable than you may have ever experienced in the past.

Waterlase™ offers a gentle alternative to a wide variety of dental treatments. Fillings last longer and tooth structure is preserved, extending the life of your teeth. Most of all it is a generally pain free treatment.

How does it work?

Waterlase™ uses a Hydrokinetic™ process to energise water which

then gently and precisely washes away decay in both tooth enamel and gum tissue. Fast, efficient, no drilling and most importantly, usually no more numbing injections!

Gum Disease

Four out of five adults have gum disease. Not only does this initially result in bleeding gums and bad breath but eventually will result in bone deterioration and loss of teeth. Now with Waterlase™ laser treatment we can at last treat gum disease effectively and with regular treatments gum regeneration can result.

What is Waterlase™ not used for?

The Waterlase™ can not be used to remove old amalgam, porcelain or metal fillings. Traditional dentistry applies in these cases.

Air abrasion

This technology uses compressed air to remove decay with a high speed stream of microscopic particles. Like Waterlase™ treatment, this process does not usually require an anaesthetic. It does not weaken the structure of the tooth as can often occur with traditional drilling.

The new generation

The best investment you can make in your children and young people's oral health is to ensure Microdentistry is part of their regular health checkups.

YOU!

Many people can benefit from microdentistry. You no longer have to fear going to the dentist.

So what's stopping you now?
